

Scan a QR. Get the **right** **manual,** every time.

A Connected Worker Platform purpose-built for material handling and industrial automation. Stick a code on every machine. Your technicians scan, see authored content scoped to that exact serial, and resolve issues without flipping through 700-page PDFs.

- ☑ No app to install
- ☑ Built for shop floor
- ☑ Compliance-grade audit

From scan to fix in three steps.

No new hardware. No new software for your team. Your existing documentation becomes a structured, searchable, audited resource.

01

Stick a QR on the machine

Branded QR labels printed and shipped. Place them next to nameplates, control panels, or access doors. Each code resolves server-side — re-targetable, revocable, audit-logged.

02

Tech scans with any phone

Native camera, no app to install. The PWA loads instantly and resolves to the asset's authored content pack — model, serial, content rev, install date, all in one screen.

03

Right answer, every time

Section-anchored manuals, parts lists with diagrams, structured procedures, AI assistant grounded on your published content. Safety-critical procedures quoted verbatim.

Why this matters

MHI technicians spend 20-40% of their wrench time hunting for the right manual page. Equipment Hub collapses that to a single QR scan — and every interaction is audit-logged for compliance, training records, and procedure evidence.

01 • Identification

One scan. The whole asset.

Brand-aware UI shows model code, serial, content revision, customer, install date, and any open work orders — before the tech even reads a manual.

- Scoped to the exact serial — two identical machines at different sites can have different content versions
- Branded per OEM with custom logos, colors, and accessibility-validated contrast
- Server-side QR resolution — re-target on equipment swap, revoke on theft

02 • Documentation

Sectioned by part. Anchored to the page.

Manuals split into part-specific sections. Page ranges for PDFs, time codes for video, text excerpts for markdown. Authored once against an asset model.

- Page anchors with optional Y-crops for sub-page boundaries
- Automatic re-validation when OEM publishes a manual revision
- Procedures author-able as structured checklists with step-by-step evidence

03 • AI assistant

An AI that knows your equipment.

Ask anything about the equipment. Answers are grounded on the published content for that exact serial — every claim traces back to a section in the manuals. Safety-critical procedures quoted verbatim, never paraphrased.

- RAG retrieval over the asset's pinned content version
- Refuses to summarize lockout/tagout — quotes the OEM directly
- Source citations on every paragraph

04 • Procedure viewer

Open straight to the right page.

PDF sections render at the exact page range with safety warnings flagged. Pinch-to-zoom on phones, fullscreen on tablets. Every view audit-logged with timestamp, user, and content revision.

- Native PDF rendering (pdfjs); no print-and-scan workflow
- Safety-critical banner forces verbatim review before override
- Scoped to the asset's pinned content version — frozen for audit

05 • Parts catalog

Every part, every diagram, one tap.

Searchable by part number, name, position, or cross-reference. Each part links to its install procedure, exploded views, and OEM-branded ordering — re-routing aftermarket revenue back to the OEM.

- BOM hierarchy with parent-part drill-down
- Cross-reference search for legacy part numbers
- OEM-controlled ordering links — capture aftermarket leakage

06 • Issue reporting

Report from the floor in 30 seconds.

Severity, photos, attachments — issues route to maintenance with the asset, scan history, and content rev attached. Phase 2 syncs work orders to your CMMS via webhook (Maximo, UpKeep, Fiix).

- Native camera capture with auto-attached EXIF metadata
- Five severity levels with color-coded urgency
- CMMS bidirectional sync on roadmap

Capture tribal knowledge in real time.

Techs document procedures right at the equipment. Voice-to-title, step-by-step photo and video evidence, time-stamped on every action. Saved as *unverified* drafts; an admin promotes them to published content.

- Voice input for step titles and notes — gloved hands welcome
- Auto-saved drafts survive battery death, app crash, lost signal
- Admin promotion workflow keeps the field log honest
- Every step gets timestamped photo/video evidence
- Procedures become reusable training material on promotion
