

Built for the workshop tablet. Optimized for techs.

The same Connected Worker Platform — purpose-built for material handling and industrial automation — at full iPad scale. More manual on screen, more parts visible, fewer taps to fix the machine. No app to install; runs in Safari, installs to home screen, works offline for recently-viewed content.

☑ Native PWA, no App Store ☑ Same auth, same data

☑ Offline-ready

A workshop tablet at every line.

Mount an iPad next to each major machine. Same QR scan flow, expanded canvas — the maintenance team gets a tablet-class view of the manuals, parts, and procedures they reach for every day.

01

Mount it on the line

Wall-mounted iPads at every major sub-system. Always charged, always available, always pointed at the equipment they cover.

02

Scan or pin the asset

Pin a wall-mounted tablet to a specific machine, or use the iPad's camera to scan QR codes on adjacent equipment. Same session model, same audit trail.

03

Full canvas, full content

More manual on screen, parts and exploded views beside the diagram, AI assistant in a side panel. Fewer taps to do the same job — measurably faster MTTR.

Why iPad

A 12-inch canvas makes a meaningful difference for maintenance work — schematics readable without zoom, BOM and exploded view side-by-side, AI assistant in a docked side panel. Same platform and authoring; different ergonomics. Wall-mount one at every line and your floor becomes self-service for routine work.

01 • Identification

The whole asset, one glance.

Brand-aware UI shows model code, serial, content revision, customer, install date, and any open work orders — laid out across the iPad's full canvas without scrolling.

- Scoped to the exact serial — two identical machines at different sites can have different content versions
- Branded per OEM with custom logos, colors, and accessibility-validated contrast
- Server-side QR resolution — re-target on equipment swap, revoke on theft

02 • Documentation

Sectioned by part. Anchored to the page.

Manuals split into part-specific sections. The iPad grid view shows section thumbnails, page ranges, and unverified field-procedure overlays at a glance.

- Page anchors with optional Y-crops for sub-page boundaries
- Automatic re-validation when OEM publishes a manual revision
- Field-captured procedures show as unverified until an admin promotes them

03 • AI assistant

An AI that knows your equipment.

Plain-English questions, cited answers grounded on this asset's published content. Safety-critical procedures quoted verbatim. The iPad's wider chat surface makes long technical answers easy to scan.

- RAG retrieval over the asset's pinned content version
- Refuses to summarize lockout/tagout — quotes the OEM directly
- Source citations on every paragraph

04 • Parts catalog

Every part, every diagram, one tap.

Searchable by part number, name, position, or cross-reference. Each part links to its install procedure, exploded views, and OEM-branded ordering — re-routing aftermarket revenue back to the OEM.

- BOM hierarchy with parent-part drill-down
- Cross-reference search for legacy part numbers
- OEM-controlled ordering links — capture aftermarket leakage

05 • Issue reporting

Report from the line in 30 seconds.

Severity, photos, attachments — issues route to maintenance with the asset, scan history, and content rev attached. The iPad form keeps the asset header in view while the work-order is being filled.

- Native camera capture with auto-attached EXIF metadata
- Five severity levels with color-coded urgency
- CMMS bidirectional sync (Maximo, UpKeep, Fiix) on roadmap

06 • Field authoring

Capture tribal knowledge in real time.

Techs document procedures right at the equipment. Voice-to-title, step-by-step photo and video evidence on a tablet keyboard, time-stamped on every action. Saved as *unverified* drafts; admin promotes them to published content.

- Voice input for step titles and notes — gloved hands welcome
- Auto-saved drafts survive battery death, app crash, lost signal
- Admin promotion workflow keeps the field log honest
- Procedures become reusable training material on promotion

Same QR. Three buyers. Different value.

OEMs, integrators, and end-customers each pay for different value from the same physical asset. Mounted iPads on the floor are the end-customer's investment; the platform underneath is shared.

OEM

Capture aftermarket revenue

Brand every Honeywell sorter, every Intralox splitter, every SICK scanner with content that routes parts orders back to you — no leakage to third-party distributors.

Starting at

\$30k / yr

INTEGRATOR

Service margin protection

Faster MTTR, better first-time-fix rate, and lower truck-roll frequency across your active project portfolio. Service contracts stay profitable.

Starting at

\$42k / yr

END-CUSTOMER

Workshop tablets at every line

Mount iPads at every major sub-system. One platform across every OEM, every integrator, every decade of installed equipment. Audit trails included.

Starting at

\$80k / yr per site

//

A 12-inch canvas at every line turns documentation from a thing techs ignore into a thing they reach for. Same platform — different ergonomics, measurably better outcomes.

BETA PROGRAM

Five companies. Ninety days. \$0 to participate.

We're selecting five MHI integrators and OEMs for a structured 90-day beta. SANTECH authors your content, ships branded QR labels, runs weekly check-ins, and gives you founding-member pricing at day 90. Estimated value of included services: ~\$25,000.

[Request a beta slot →](#)

Founding-member pricing locks 50% off list for 24 months

INTEGRATOR

\$42 – 120k / yr

OEM

\$30 – 250k / yr

END-CUSTOMER

\$80 – 150k / yr per site
